                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  microorganisms such as Leishmania and Mycobacterium tuberculosis. Fu polypeptides are used for enhancing the expression of polymucleotide as in vivo diagnostic agents and for raising antibodies in a non-hum animal. The invention is used in gene therapy. The present sequence MTB59F fusion protein. This fusion protein comprises Ra35 protein fr Mycobacterium tuberculosis and TbH9 protein from Mycobacterium sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention comparising such fusion proteins. The present invention comparising such fusion proteins. The present invention comparisions comprising such fusion proteins. The present invention comparision controlled to the protein of the protein colors and sensitivity of sera from individuals infected with controlled to tuberculosis and methods for their use in diagnosis, prevention and controlled to the colors of the invention and in vivo assays for detecting humoral controlled to generate or cell-mediated immunity against M. tuberculosis, for the colors of an infection or monitoring of disease progression, as compared to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human colors of the invention are also used as vaccines. MTB32A controlled the colors of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is Mycobacterium species.

                                                                                                                                                                                                                                                                                                       The invention relates to a purified polypeptide which induces an immune response of Mycobacterium tuberculosis. Polypeptides of the invention ar useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis infection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Reed

                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a recombinant Mycobacterium tuberculosis tri-antigen fusion protein, termed Mtb61f, composed of the antigens TbH9, DPV and MTI. The fusion protein is expressed in host cells using a vector carrying a polynucleotide (see AAZ20203) comprising the coding sequences for the 3 antigens. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polynucleotides encoding them are useful as vaccines for preventing tuberculosis (claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective immunogens than mixtures of the individual protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New fusion proteins useful for diagnosis, prevention and treatment of tuberculosis -

                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
